Actor Update Summary Format – Draft 1

This, along with the Event Summary Format, defines the standard output from the "Analyst MCP Server". These are used directly to generate the HTML/JSON report.

```
{
    "name" : "%country1%",
    "actor_type" : "country",

    "impact" : 0.0,
    "public_opinion" : 0.0,
    "controversy" : 0.0,
    "mentions_weight" : 0.0,
    "linked_themes" : ["%theme1%", "%theme2%"]
}
```

Justifications

-

Guidance on populating

- The "impact" field should hold a value between -10 and 10, representing how beneficial the news events were to this particular actor.
- The "public_opinion" field should hold a value between -10 and 10, representing how positive the public's opinion of the actor in the current news is. This is tightly linked to the "controversy" field, which encodes the spread of opinions seen in a value from 0 to 10, where 0 indicates that all sources mentioning this actor had similar opinions, and 10 indicates maximally opposed opinions of the actor were seen in different sources
- The "mentions_weight" field represents the percentage of articles considered which mentioned this particular actor, and should range from 0 to 100. This field can be used to determine how impactful, reliable or widespread the news on the actor is.
- The elements of the "linked_themes" array should all be associated with theme_update_summary records

Event Summary Format – Draft 1

This, along with the Actor Update Summary Format, defines the standard output from the "Analyst MCP Server". These are used directly to generate the HTML/JSON report.

```
{
    "event" : "%event%",

    "controversy" : 0.0,

    "economic_impact" : {
        "severity" : "%low%",
        "justification" : "%single sentence justification%"
    },
    "financial_market_impact" : {
        "severity" : "%medium%",
        "justification" : "%single sentence justification%"
    },
    "security_impact" : {
        "severity" : "%high%",
        "justification" : "%single sentence justification%"
    },
    "diplomatic_impact" : {
        "severity" : "%low%",
        "justification" : "%single sentence justification%"
    }
}
```

Justifications

-

Guidance on populating

- The "controversy" field is populated as in the Actor Update Summary Format – it "encodes the spread of opinions seen in a value from 0 to 10, where 0 indicates that all sources mentioning this [event] had similar opinions, and 10 indicates maximally opposed opinions of the [event] were seen in different sources"
- Each XX_impact field should have a "severity" subfield set to one of "low", "medium", or "high", accompanied with a single sentence justification of why this is the case, stored in the "justification" subfield. If no impact: "No material impact identified." Honest nulls > hallucinated outputs.
- The fields cover the following:
    - Economic:
        - Trade/sanctions, supply chains, com
    - Financial Markets:

        - FX, equity sector exposure, soverei
    - Security:
        - Military escalation, terrorism, cyb
    - Diplomatic:
        - Alliance shifts, IO responses, sanc
    - XX note that this needs to be completed once Robert replies on Slack to complete each field
